PROFILE

Game programmer with five years of professional games experience, focused on Unreal Engine and C++ across gameplay systems, rendering diagnostics and console performance. Delivered multiplayer ARPG gameplay, designer-facing systems and production fixes across partner-studio projects. Combines platform debugging and profiling with engine tooling experience to solve technical problems from feature development through release support.

TECHNICAL SKILLS

Unreal gameplay: C++ gameplay implementation in networked multiplayer projects; Gameplay Ability System (GAS), State Trees and Environment Query System (EQS).

Rendering & performance: Lumen and Virtual Shadow Maps troubleshooting; Unreal Insights profiling; Xbox Series X and PlayStation 5 SDK debugging within rendering budgets and platform requirements (TRCs).

Tools & production: Data Table management, automated tests, Backtrace issue resolution and hotfixes; Perforce and Git.

Wider engineering: C#, Unity, DirectX 11, Gameface, SFML, Python, Java, Scala, JavaScript, TypeScript, AngelScript, Angular and Ionic; Windows, Linux and macOS.

PROFESSIONAL EXPERIENCE

Game Programmer | Rocket Science

July 2026 - Present

Crimson Moon

Developer: ProbablyMonsters | Programmer | July - October 2026

- Diagnosed and fixed Unreal Engine rendering issues before and after release, ensuring stale Virtual Shadow Maps data was refreshed and Lumen was enabled correctly.
- Profiled and optimized Xbox Series X and PlayStation 5 builds through extensive platform SDK debugging and Unreal Insights analysis, keeping performance within rendering budgets and platform technical requirements (TRCs).
- Resolved production issues reported through Backtrace and delivered hotfixes using Unreal Engine, C++ and Perforce.

Game Programmer | Double Eleven

April 2021 - April 2026

Minecraft Dungeons II

Programmer | Mojang / Double Eleven

- Implemented gameplay logic for a networked multiplayer ARPG using Unreal Engine State Trees, Gameplay Ability System (GAS) and Environment Query System (EQS), translating designer requirements into working systems.
- Developed Data Table management systems to support game-data workflows and wrote automated tests to validate implementation.

Ridam Rahman

Game Programmer | Double Eleven experience continued

Grounded 2

Programmer | Obsidian / Double Eleven

- Developed Playground-mode gameplay features using Unreal Engine systems, translating designer requirements into implementation in collaboration with designers and UI artists.

Fallout 76

Programmer | Bethesda Game Studios / Double Eleven

- Extended Creation Kit tooling to support multiple disciplines, including mesh export with embedded textures, materials and mesh data.

RimWorld: Console Edition

Programmer | Ludeon / Double Eleven

- Adapted the PC user experience for consoles and optimized performance on lower-end hardware.
- Reimplemented UI using Coherent Gameface and built a translation management system integrating thirteen language repositories.

ENGINEERING DEVELOPMENT

My engineering career began in full-stack development and system administration, followed by postgraduate study in games technology. At Double Eleven, I built experience in console adaptation, engine tools and production workflows before applying Unreal Engine systems to multiplayer gameplay and designer-facing features. At Rocket Science, that foundation expanded into Unreal rendering diagnostics, console performance optimization and live-release support.

EARLIER EXPERIENCE

Full Stack Developer | PC-Cube

April 2018 - July 2019

Developed progressive web applications for public administration using Angular and Ionic. Supported system administration alongside IBM at the Italian Ministry of Justice.

EDUCATION

MSc Computer Games Technology | Abertay University

2019 - 2020

Thesis: Using Generative Adversarial Networks for Content Generation in Games. Focus: AI, game design, procedural methods and network development.

BSc Computer Science | Sapienza University of Rome

2015 - 2018

Thesis: QuBE - The Quiz Battle Editor: An environment for educational game development.

SELECTED PROJECTS

Onirico: Lead programmer / designer: designed and implemented Unity gameplay, movement, stealth and UI.

Procedural Scene: Built a DirectX 11 scene with procedural terrain, Voronoi dungeons, collision detection and post-processing.

Roll-A-Ball-AI & SFML Hockey: Compared finite-state and reinforcement-learning AI in Unity; built a two-player client-server game using SFML.
